AMENDMENTS TO THE SPECIFICATION

In paragraph **[0008]** of the originally filed application, please amend as reflected in the following marked-up version of the paragraph:

[0008] Typically, the server computer only needs to examine the portions of the HTTP request that may contain data derived from outside input (and thus does not need to examine portions of the HTTP request containing data not derived from outside input). The portions of the HTTP request at risk are examined for the presence of script constructs. In addition to searching for script constructs or indicators such as angle brackets, the present invention also searches for other script constructs that are only harmful when rendered inside of particular HTML elements. Elements that could be used in a cross-site scripting attack include, but are not limited to, events, expressions, and the like.
